

Dmitry Glukhov, AI Engineer

Coimbra, Portugal / dimkin3@gmail.com / Telegram: [dimkin3](#)

Working with practical LLM systems, scientific data analysis, speech-to-text and OCR workflows, and document automation.

My background combines applied engineering with a scientific way of thinking: I care about how models behave, how outputs are evaluated, and how AI tools can be made useful in real workflows rather than left as prototypes.

Education

- Kazan National Research Technological University
- Candidate of Sciences in Chemistry (PhD equivalent)

Highlights

- LLM and RAG-like knowledge pipelines over messy real-world data.
- OCR and speech-to-text workflows with stabilization of noisy partial results.
- Document and content automation: extraction, Markdown/TXT generation, localization, editable deliverables, and QA artifacts.
- Multi-provider AI integration: hosted models, local endpoints, provider routing, and quota-aware workflows.
- Evaluation-minded development: validation, repair loops, operation logs, diagnostics, benchmark reports, and reproducible pipeline stages.
- Production-oriented delivery: modular boundaries, tests, lint/type checks, local diagnostics, architecture notes, and reviewable artifacts.

Tools

- **Development:** Python, TypeScript, Swift, Rust, Docker, and command-line automation.
- **AI:** OpenAI-compatible APIs, OpenRouter, Codex, Gemini, local LLM endpoints, prompt workflows, provider routing, OCR pipelines, speech-to-text, and validation/repair loops.
- **Analytics:** SQLite, Postgres, Python analysis scripts, Matplotlib, PySCF, LAMMPS, benchmark reports, classifier calibration, and reproducible scientific/data-analysis pipelines.

Featured Public Projects

- [ai-agent-case-studies](#) — sanitized AI-agent and LLM workflow case studies, including a Telegram / LLM knowledge system.
- [native-audio-translator](#) — native macOS live subtitle and translation prototype with speech-to-text and OCR pipelines.
- [mermaid-compiler](#) — AI-assisted Mermaid diagram generator, editor, validator, and repair workspace.
- [dodo-table-events](#) — computer vision prototype for table occupancy events.

Notes

Some current work is private. This repository summarizes the technical shape of that work without exposing private data, credentials, client materials, or closed-source code.
